SANJIVANI · Health for Everyone

Find a Hospital Bed Before It's Too Late.

An AI-powered, GPS-aware web app that helps patients locate the nearest hospital with the right bed available — in seconds.

GPS & Real-Map Data | AI Symptom Triage | Live Bed Availability | Built for Emergencies

Submitted by Team Sanjivani

Project Pitch · For Judges

The Problem we're solving

01

In a medical emergency, every minute counts. Yet patients and ambulance drivers in India have no fast, reliable way to know which nearby hospital actually has a free bed of the right type.

Wasted Time

Families call hospitals one by one — only to find no ICU beds, no emergency capacity, or wrong specialty.

No Visibility

There is no consumer-friendly map of nearby hospitals with bed-type availability shown together.

Wrong Triage

Patients often don't know whether their symptoms need General, Emergency or ICU care — and head to the wrong department.

Our Solution

02

Sanjivani is a single web app that combines real hospital location data, AI-powered symptom triage, and bed-type filtering — so any patient can find the right care in three taps.

G

GPS-First Discovery

One-tap access to your location. We auto-fetch hospitals within 10 km — and expand to 25 km if results are sparse.

M

Real OpenStreetMap Data

Hospitals come from live OSM (Overpass + Nominatim APIs) — not a stale local list. Works for any city worldwide.

AI

Gemini Symptom Triage

Type symptoms → Google Gemini suggests General / Emergency / ICU and offers a safe home remedy when appropriate.

B

Bed-Type Filtering

One click filters the entire map for the bed type the AI recommended — patients don't have to guess.

L

Live-Feel Updates

Bed counts refresh every 30 seconds, mimicking the real-time feel hospital networks should provide.

D

One-Tap Directions

Every card has direct Google Maps "Directions" and "View Details" links — no copy-pasting addresses.

How a Patient Uses It

03

Five steps from "panic" to "on the way to the right hospital".

1. **Open App** — Welcome screen with two clear paths.
2. **Allow GPS** — App finds you and nearby hospitals automatically.
3. **Type Symptoms** — "chest pain, breathlessness"
4. **AI Suggests** — Gemini recommends ICU + explains why.
5. **Filter & Go** — One tap shows only hospitals with ICU beds.

Why It Matters

04

3	10 km	3	24/7
Taps to find a bed	Default search radius	Bed types triaged by AI	Always available, no app install

Who benefits

Patients & Families

No more calling 10 hospitals during an emergency. Find the right one immediately, with directions in one tap.

Ambulance Drivers

A clear, location-aware shortlist by bed type makes routing decisions faster — especially in unfamiliar cities.

Tier-2 / Tier-3 Cities

OpenStreetMap covers smaller towns where commercial map services are sparse. Sanjivani works there, today.

First-Time Patients

Symptom triage helps people who are scared and unsure whether they need a clinic, casualty, or critical care.

> *"The difference between a good outcome and a tragedy is often just **information at the right moment**. Sanjivani delivers that information in seconds, on any phone, with no app install."*

Tech Stack

05

Built fast with modern, production-grade tooling. Zero heavy frameworks on the client — works on low-end devices.

Frontend

HTML5 | CSS3 (Custom Design Tokens) | Vanilla JavaScript (ES6+) | Canvas 2D (animated globe) | IntersectionObserver (scroll FX)

Backend

Node.js | Express | Nodemailer (SMTP) | CORS | dotenv

Data & AI Services

Google Gemini (2.5 Flash & fallbacks) | OpenStreetMap Overpass API | OpenStreetMap Nominatim API | Browser Geolocation API

Engineering Highlights

- **Fallback chain for reliability** — Overpass fails? Auto-fall back to Nominatim. Gemini 429s? Exponential-backoff retry across 3 model tiers.
- **Strict triage prompt** — the AI is constrained to return JSON-only, normalized to General / Emergency / ICU, with a safer default.
- **Pure-static frontend** — works without a build step; deployable on any static host.
- **Backend-only secrets path defined** — production roadmap moves the Gemini key out of the client.

How We Compare

06

Capability	Google Maps	Practo / 1mg	Hospital Apps	Sanjivani
GPS-based nearby hospitals	✓	✗	✗	✓
Bed-type availability view	✗	✗	✓ (single-hospital)	✓
AI symptom triage	✗	✓ (chat)	✗	✓
Filter map by bed type	✗	✗	✗	✓
Works without account / install	✓	✗	✗	✓

Capability	Google Maps	Practo / 1mg	Hospital Apps	Sanjivani
Open data (any city worldwide)	✓	✗	✗	✓

What's Next

07

A clear path from a hackathon prototype to a public-good service.

Phase 1 — Live Pilot

Partner with 5 hospitals in one city to integrate **real bed counts** via a simple write API. Replace the simulated counts with truth.

Phase 2 — PWA & Multilingual

Installable Progressive Web App, offline-capable, with Hindi / Marathi / Tamil support for tier-2 reach.

Phase 3 — Ambulance & Insurance

Direct booking, ambulance dispatch hand-off, and insurance pre-auth status — moving from "find a bed" to "get treated".

Our Ask

08

Hospital Partnerships

Introductions to 3-5 hospitals willing to pilot a real bed-count feed. We provide the integration in < 1 week.

Mentorship

Guidance on healthcare data standards (FHIR, ABDM) and on moving secrets / inference to a hardened backend.

What we already built (working today)

- End-to-end working web app — landing pages, GPS discovery, AI triage, contact form via SMTP.
- Live data from OpenStreetMap, not a static seed list.
- Resilient fallback chains across both map APIs and AI models.
- Mobile-responsive UI with a polished marketing surface for trust-building.

> *Sanjivani is not a slide deck — it is a **working product**. Open the link, allow GPS, type a symptom. In ten seconds you'll see what we built.*

Sanjivani · Connecting patients to the right care, instantly. Thank you for your time. Questions welcome.
